

Retail Sales & Cost Analysis Dashboard

Power BI project report

August 27, 2026

Armaan Chima

Overview

This report documents a two-page Power BI dashboard built to analyze retail sales performance, cost drivers, and target achievement across a chain of stores. The project was completed as part of the CFI Power BI Fundamentals training, focusing on dashboard user experience and interactivity.

The dashboard moves from a high-level sales summary on the first page to store-level cost and staffing detail on the second, connected by a drill-through action. The sections below walk through what was built, page by page, along with the data model and skills involved.

Sales Page

The Sales page provides a top-level view of business performance. It includes KPI cards for Total Sales, Total Sales YTD, and Total Gross Margin, a map visual plotting sales by store location colored by store type, a clustered column chart breaking down sales by department and store type, and a ribbon chart showing how department rank shifts across store locations over time.

Slicers for date, department, and store type sit above the visuals, and cross-filtering is enabled so that selecting a region on the map filters the column chart and ribbon chart automatically.

Figure 1. Sales page

Cost & Target Page

The Cost & Target page is a drill-through page reached from the Sales page, filtered automatically to the store type selected on entry. It contains a table comparing total sales, total wages, and the difference from target by store location, a scatter chart plotting store size in square feet against total rent to compare cost efficiency across the store fleet, and a KPI visual tracking total sales against target over time.

Navigation buttons let a user move between the two report views without using the page tabs.

Data Model

The report runs on a star-style model with five tables:

- Retail Sales, holding the Total Sales and Total Sales YTD measures
- Retail Cost, holding Total Gross Margin, Total Wages, Total Rent, Store Size, Total Target, and Difference From Target
- Store Details, with store location, store type, and store ID
- Categories, with department information
- Date, used for time intelligence and filtering across both pages

Skills Demonstrated

- DAX measure design, including a year-to-date calculation and a variance measure comparing actuals to target
- Dashboard information architecture, pairing a summary page with a drill-through detail page instead of one crowded canvas
- Cross-filtering and slicer configuration to make the report interactive rather than static
- Chart selection matched to the question being asked, including a ribbon chart for rank over time and a scatter chart for cost efficiency
- Data modelling across multiple related tables

Tools Used

Power BI Desktop, DAX, Power Query
